This article applies to:

Expanded hover selection for contacts in contact lists

Currently you have to hover directly over the avatar in any contact list in order for it to change to the checkmark. The checkmark can then be selected in order to take a bulk action. With this update, now when you hover over any part of the contact in the contact list, the checkmark will be enabled to help with discovery and usage of bulk actions.

Bug fixes

- Some date type custom field values did not update during import on existing contacts

- Unable to publish a campaign where the Landing Page Form Submission goal was connected directly to a decision diamond
